

Resolution of the Extra Terrestrial Issue??

2026

Thomas A. Burns PhD.

Klamath Falls, Oregon

For many thousands of years, homo sapiens shared the surface of planet Earth with other Homo species. So, a mix of hominoid species existing together on Earth is nothing new.

If the plethora of explicit data presented in The Blue Planet Project Trilogy [2012 - 2022] by Jefferson Souza [edited by Gil Carlson] is mostly accurate, several hominoid species originally from other star systems have been sharing Earth with its surface dwelling homo species for many thousands of years from highly developed bases located deep in the Earth's interior [both under the oceans and the land]. Still other hominoid species from other star systems have been exclusively visitors to Earth. In general, these extra Earthly hominoids have been in contact with Homo Earth species for a very long time and are much more highly advanced in communications and technology than Homo Earth species – including modern homo sapiens. In some other respects, these extra Earthly hominoids lack some Homo sapiens capabilities and are experimenting with inter-species genetics to develop greater overall species competence.

Given their advanced technological and inter-dimensional capabilities, these extra Earthly hominoid species could have easily eliminated Homo Earth species, but they have not. Since the end of WWII and the use of nuclear weapons, extra Earth hominoid species have become more interactive, and the major modern homo sapiens governments of Earth have secretly engaged in direct agreements with these extra Earth species to gain access to their technology while allowing them to continue to share Earth's ecological resources and experiment with genetic options. Some extra Earth bases deep in Earth's interior are even shared at different levels between homo sapiens scientists and these extra Earth hominoids.

Different Homo species sharing Earth is nothing new. Cooperatively sharing Earth more broadly among Earth bound and extra Earth hominoid species is new – at least for modern homo sapiens in complex society. Adjusting to this “new” situation may well constitute a soon to be recognized major challenge, especially since it removes the crown of species superiority from homo sapiens.

If the condition regarding extra terrestrials described above is accurate, the most astonishing fact is that our governments have been so successful worldwide in suppressing its revelation given both a free press and intense scientific curiosity. Can disinformation, suppression, and threat campaigns truly work at this scale?
